Photosynthesis

Photosynthesis is the process by which green plants use sunlight to make food.

Chlorophyll in the chloroplast absorbs light energy from the sun.

Carbon dioxide and water are converted into glucose and oxygen.

The overall reaction is six carbon dioxide plus six water yielding glucose and six oxygen.

Respiration

Cellular respiration releases energy stored in glucose.

It takes place in the mitochondria of plant and animal cells.

Aerobic respiration uses oxygen and produces carbon dioxide and water.

Fermentation is an anaerobic pathway that produces less energy.
